## Figures

1.1 Formulation and implementation of transport policy measures 6

2.1 Policy categories 14

2.2 NO$_x$ emissions by road traffic 15

2.3 Research approach 17

2.4 User interface and sample display from PACE-FORWARD 18

2.5 Actors involved in the FORWARD project 21

2.6 Conceptual structure for classification of success elements 22

4.1 The stages of the environmental chain 63

5.1 Diagram of the entire system study 77

5.2 Overview of the terminology applied 78

5.3 Dimensions and position of the various scenarios 80

5.4 Relative spatial spread of housing in 1990 and in each of the scenarios (2050) 82

5.5 Change in number of houses per scenario beyond the ‘Randstad’ in the non-urban areas 83

5.6 Energy costs and total variable car costs per kilometre 83

5.7 Total mobility growth between 1990 and 2050, for the four scenarios 87

5.8 Change in the number of car-kilometres between 1990 and 2050, for the four scenarios 88

5.9 Change in the number of public transport passenger-kilometres between 1990 and 2050, for the four scenarios 88

5.10 Modal split in goods transport in 2020 90

5.11 Number of cars per household 95

5.12 Change in vehicle-kilometres per propulsion concept in individual passenger transport 98

5.13 Change in passenger-kilometres per propulsion concept in collective passenger transport 100

6.1 Innovations in the transport system that may help to solve problems of environmental pollution and road congestion 116

6.2 Time frames in the development of electric drive technologies 122

8.1 Efficiency improvement by cooperation and introducing an intermediary 160
8.2 Fundamental characteristics of underground infrastructure 161
8.3 Underground objects 163
8.4 Underground sections linked by ramps to surface infrastructure 164
8.5 Underground links with start and end terminals 164
8.6 An underground network with terminals 165
8.7 Direct distribution 168
8.8 Round trips 169
8.9 Underground system: direct distribution 169
8.10 ‘Discrete’ improvement in accessibility 173
9.1 ‘Beads on a string’: the classic proforma for public transport orientation 188
9.2 A ‘quasi-radial’ pattern of access routes which appear to ‘focus’ on the public transport stop 192
9.3 Pedestrian network context 193
9.4 Example of a tartan grid 198
9.5 Extension of a public transport corridor at the urban periphery 200
10.1 Car ownership in the Netherlands between 1946 and 1998 210
10.2 Annual kilometres travelled in the Netherlands between 1960 and 1998 211
10.3 Map of the case-study locations in the Randstad 219
10.4 Locations of the new residential areas in the Brabant case study 221
10.5 Total increase or decrease in the distance to work due to the move (Brabant case study) 225
11.1 Relationships between activity locations, needs and desires, transport resistances and passenger transport 234
12.1 World exports as a percentage of GDP 259
12.2 A multilayer approach for tracing the effects of internationalization 261
12.3 Transport and the global environment: carbon dioxide emissions, 1986 and projected for 2010 281
