## Tables

2.1 Success elements mentioned by actors relating to FORWARD 29  
3.1 The authority and main considerations in enacting selected measures in Israel 38  
3.2 Parameters that affect the main policy areas 39  
3.3 Main attributes of selected policy measures 44  
3.4 A spatially and temporally differentiated framework 47  
4.1 Estimates of the implications of noise nuisance effects on property values 59  
4.2 Relative fuel consumption of air transport 60  
4.3 Comparison of long-run average social costs of passenger transport 61  
4.4 Taxonomy of policy instruments 67  
5.1 Several features of the various scenarios 81  
5.2 Fares for collective passenger transport per scenario 84  
5.3 Overview of traffic and transport system components per scenario 86  
5.4 Transport performance goods transport, per mode of transport 89  
5.5 Change in vehicle kilometres in individual passenger transport, 2020 and 2050 92  
5.6 Number of shared cars in the sustainable scenarios 92  
5.7 Change in passenger-kilometres in collective passenger transport, 2020 and 2050, per transport concept 94  
6.1 The present situation: two (highly disjunct) regimes of passenger transport 109  
6A.1 Evolution of emissions standards in the EU 134  
6A.2 California clean air requirements 135  
7.1 The role of the government 145  
7.2 Assessment of general policy requirements for underground freight transport in the Netherlands 148  
7.3 The strategy framework 153  
8.1 Problems for and resulting from goods transport 157  
8.2 Provisions for underground use of different types of vehicles 166  
8.3 Comparison of underground goods transportation systems 168
8.4 Logistic concepts with average speeds at links 170
8.5 Logistic concepts with delivery times 170
8.6 Comparison of surface and underground goods distribution 172
9.1 The emerging consensus in public transport orientation 186
9.2 Examples of catchment area attributes 187
9.3 Checklist of pedestrian- and transit-friendly features 190
10.1 Assumed effects of urbanization factors on mobility 215
10.2 Effect of the move on the number of kilometres travelled per week for each location (Randstad case study) 220
10.3 Modal share in the journey to work by location (Randstad case study) 220
10.4 Distribution of dwellings by location type (Brabant case study) 223
10.5 Share of mode of transport in the journey to work by location type (Brabant case study) 223
10.6 Increase and decrease in the distance to work due to the move (Brabant case study) 224
11.1 Share of transport in Dutch emissions, 1997 232
11.2 Relationships between instruments and objectives 233
11.3 Car and public transport use for four urbanization concepts 236
11.4 Car and public transport use in scenarios for the distribution of new employment opportunities 238
11.5 Car and public transport use for infrastructural scenarios 239
11.6 Car and public transport use for the EROMOBIL Working Group 240
11.7 Car and public transport use and land-use scenarios 241
11.8 Promising urbanization options tested 242
11.9 A comparison of the studies 244
12.2 The ‘world’ economy and its components, 1980–1987 265
12.3 World population growth: years to next billion 267
12.4 Population projection by region 267
12.5 Costs of air transportation, telephone calls and computer price deflator 271
12.6 Modal split of freight transport in 12 European countries 276
12.7 European supply sourcing 277
12.8 Passenger air transport 279
