Tables

2.1 Different views on entrepreneurship  
3.1 Category changes over time in 8562 surviving (1987–96) Swedish firms with 20 or more employees in 1996  
3.2 Different units of analysis and rankings of their suitability within different theoretical perspectives  
3.3 Different units of analysis and their relevance for different user groups  
3.4 Different units of analysis and their ease of use in empirical research  
3.5 The relationship between unit of analysis and suitable growth indicators  
4.1 Descriptive statistics for the 55 studies  
4.2 Dimensions of growth and their frequencies  
4.3 Calculations of growth and their frequencies  
4.4 The measurement periods in number of years and their frequencies  
4.5 Correlation matrix of the investigated 12 growth measures (n = 396)  
4.6 Explained variance for different growth measures with the same model  
4.7 Results from the empirical model with 95 per cent confidence interval for B (n = 378)  
5.1 Sample and response rates  
5.2 Distribution of the dependent variables  
5.3 The constructs used in the analyses  
5.4a Logistic regression analysis results for separate models of expected start size  
5.4b Logistic regression analysis results for separate models of expected growth  
5.5 Logistic regression analysis results for combined models  
6.1 Sources for selection of expected consequences of growth that may influence growth motivation  
6.2 Basic characteristics of the three samples  
6.3 Independent variables. How a doubling of the number of employees is likely to affect each area
