Acknowledgments

We gratefully acknowledge the DOE’s Office of Energy Efficiency and Renewable Energy (EERE) for funding the studies that provided the core research for this book. This study benefited from input from a number of individuals across the DOE, as well as other organizations. Jeff Dowd (DOE Study Project Manager) of EERE worked closely with Gretchen Jordan (Study Project Manager, Sandia National Laboratories) and Rosalie Ruegg (TIA Consulting, Inc.) to provide guidance and review of the analysis and results.

The solar technologies research benefited from the contributions of many individuals and organizations, especially the photovoltaic (PV) companies funded under multiple DOE initiatives that generously made their current and retired senior company executives and scientists available for interviews. In addition, many technologists and analysts were consulted, and the authors wish to thank several individuals in particular who reviewed draft material and, in some cases, participated in multiple rounds of interviews. Many thanks to Roland Hulstrom (National Renewable Energy Laboratory), Terry Jester (Hudson Clean Energy Partners), Sarah Kurtz (NREL), Jim McVeigh (Sentech Inc.), Rick Mitchell (NREL), Jim Rand (formerly of AstroPower), Ron Ross (formerly of Jet Propulsion Laboratory), Peter Sheldon (NREL), Arun Soni (Sentech Inc.), Scott Stephens (DOE), Harin Ullal (NREL), and Ken Zweibel (George Washington University).

Supporting the geothermal research, Doug Blankenship from Sandia National Laboratories provided insight into the history of polycrystalline diamond compact drill bits. Gregory Mines from Idaho National Laboratory provided information on the development of binary cycle power plant technology. Toshi Sugama provided insight into high-temperature geothermal well cements, and Karsten Prusess from Lawrence Berkeley National Laboratory provided information on the TOUGH series of reservoir models.

Supporting the vehicle technology research, James Eberhardt, Chief Scientist of the Vehicle Technologies Program (VTP) at EERE, helped define the scope and provided insight on the DOE’s involvement in combustion research. Additional support was provided by Marvin Gunn.
Public investments in energy technology

former Manager of the Combustion Research Program at DOE; William
McLean, former Director of the Combustion Research Facility (CRF)
at Sandia/Livermore; Gurpreet Singh, Team Leader of the Advanced
Combustion Engine R&D subprogram within the VTP; and Dennis
Sieberts, Manager of the Engine Combustion Research Program at the
CRF.

Denise M. Mulholland from EPA was especially helpful in providing
the code and documentation for EPA’s COBRA model, which was used
to monetize health benefits from reduced emissions.

We especially want to acknowledge and thank Ross Loomis, Fern
Braun, Alex Rogozhin, Jeff Petrusa, Paramita Sinha, and Sara Casey from
RTI for their research, analysis, and writing contributions to the DOE
studies that formed the foundation of this book.
