Acknowledgements

The idea for this book emerged from a series of conversations about the career development of women in the science, technology, engineering and mathematics (STEM) fields at an Academy of Management Conference we attended. During and since those early conversations, we have benefited greatly from numerous interactions with colleagues, scholars, mentors, supporters, and friends. Melissa Marinelli has been our most valuable ally throughout; this book simply would not have happened without her tremendous assistance and support. Melissa has shepherded and coordinated the entire writing process with the contributors to this volume as well as with our publishers, and she has provided keen insight into the shape and purpose of this volume.

Diana’s passion for studying and facilitating the careers of women in STEM continues from the National Science Foundation’s ADVANCE grants at Case Western Reserve University that she has been part of for the past 12 years. Deputy Provost Lynn Singer at Case Western Reserve University, the lead Principal Investigator (PI) on these awards, remains an inspiration and much admired colleague and friend. Diana also thanks the PIs, Co-PIs, research scholars and project team members of the extended ADVANCE family for the important change work collectively undertaken to create improved institutions of higher education for the enhanced recruitment, advancement, career development, retention and leadership of women in STEM.

Linley has had a long interest in women in STEM having completed an undergraduate degree in science then worked for many years as an equity practitioner, which included a focus on career opportunities for women in non-traditional areas. The strong resources sector in Western Australia has provided ongoing opportunity to continue this interest, most recently through the Maureen Bickley Centre for Women in Leadership at Curtin University, which has encouraged a number of research projects that relate to women in STEM careers. Linley would like to also thank Melissa Marinelli not only for her outstanding contribution to this book but for her ongoing passion regarding career opportunities for women in engineering.
We thank Francine O’Sullivan of Edward Elgar Publishing for being most encouraging of the creation of this book and extremely supportive throughout our writing and editing process.

Finally and most importantly, our love and gratitude goes to all our families and friends in the US, India, and Australia, for their wholehearted encouragement of our work. This book is the result of their unreserved support.

Women in STEM careers
