Preface

The territorial division of power in federations, plus the interconnected politics at the national and regional levels, present a classic governance test for waters shared across multiple political jurisdictions. This is increasingly important as democratic transitions have introduced or invigorated federalism across diverse contexts affecting more than 300 major river basins, including approximately 50 per cent of the world’s international rivers.

In April 2012, the University of Oxford hosted an international workshop on water security and federal rivers. The workshop convened 35 delegates from 12 countries to exchange lessons learned from water reforms in federal countries. Highlights included the development of a set of case studies anchored in the insights about river basin management and federalism from multiple perspectives across public policy, economics, history and complexity science.

A keynote presentation by Dr Jerry Delli Priscoli of the US Army Corps of Engineers chronicled the history and models of river basin management in the US – the world’s oldest federation – to demonstrate the elusive quest for integrated strategies and the significant potential for solutions matched to local and regional circumstances. Case studies across the Americas, Asia, Africa, Europe and Australia highlighted the extent and diversity of federal rivers, identifying alternative pathways to share risks and manage conflicts. The workshop culminated with a preliminary synthesis and comparative reflections by George Anderson, President Emeritus of the Forum of Federations, who noted the need to learn from both success and failure: while some federations have succeeded in putting in place river basin authorities and achieving integrated management, the story more generally is one of failure. He observed that river basin organizations seem to function most effectively when water management is salient enough to merit the organizational effort but not so politically fraught that the conflict must be handled directly by politicians.

The core contribution of this edited volume is to deliver a complementary set of case studies to learn lessons from the water management experiences in nine federal countries and China. The case studies were chosen to develop both the breadth and depth of comparison. Given the spread
Federal rivers

of federalism, federal countries were chosen from a range of political and environmental settings where water issues have become catalysts for both cooperation and conflict across jurisdictions and between the state and federal levels. In many instances, two case studies are included from each country to provide (1) a broad overview of the federal system of water management coupled with (2) a more detailed case study of a specific river basin or water management ‘flashpoint’ that illustrates the contested state–federal relations in water management.

The goal is to deliver a reference volume that will motivate further comparative research and exchange among policymakers and practitioners. In doing so, authors from these countries developed case studies to provide a rounded picture of water policy and management in each federation, with a clear presentation of:

- the legal, fiscal and institutional factors that set the framework within which water policy has been developed and managed;
- the key imperatives of rational, sustainable water policy given the supply and demand characteristics of the country and the extent to which these have been developed and recognized within the country; and,
- the political dynamics, which have either aided or impeded the development of good policy or processes (including the role of crises, leadership, recourse to special powers, etc.) and the extent of consensus or conflict around water policy.

While the peculiarities of each system are such that the weight and attention given to any particular factor or issue will vary considerably, the case studies work from a common template to draw out some key lessons.

The editors wish to acknowledge and thank all workshop contributors, as well as Australian National University for sponsoring the workshop with additional support from the Forum of Federations. The workshop was organized by this volume’s editors: Dr Dustin Garrick (McMaster University and University of Oxford), Drs Daniel Connell and Jamie Pittock (Australian National University) and George Anderson (New York University).
