

Acknowledgements

The authors of this book, Timo Koivurova and Pamela Lesser, together with Sonja Bickford, Paul Kankaanpää and Marina Nenasheva, are indebted to so many people, especially given the wide geographic scope of the book. We are grateful first and foremost to the Finnish Funding Agency for Innovation (Tekes) for providing the generous grant for the research project that serves as the basis for this book on Arctic EIA best practices. A special thanks to our colleagues at the University of Lapland who supported us with various aspects of the project, in particular Assi Harkoma with her invaluable help in obtaining many of the telephone interviews in 2014, Laura Peräkylä for her wonderfully thorough research on the transboundary EIA chapter, and Kamil Jagodzinski for writing a superb and successful application to Tekes.

As the book looks not only at best practices but also at the EIA legislation and regulatory processes for all eight Arctic countries, the need to verify both is of paramount importance to the book's integrity. The authors are extremely grateful to all of the experts that graciously gave their own time to not only review the respective country chapters, but also to provide extensive and extremely constructive comments. It is not an exaggeration to say that they all significantly bolstered the authors' writings, particularly with respect to the discussion of the legislation and the EIA processes. Many of them also provided valuable insights regarding the development context of the individual countries themselves, which in turn helped the authors better understand the reason why many of these practices emerged.

Our final thanks goes to Edward Elgar Publishing, in particular Ben Booth for his interest in publishing the book and Iram Satti for her patience with several requests to extend the submittal deadline, Rose Campbell for her consummate attention to detail and finally to Madhubanti Bhattacharyya Sapia for wrapping up the editing process and graciously dealing with many more changes than were expected.
