Acknowledgements

Many people have contributed to the writing of this book with encouragement and useful suggestions. Of these, I should mention my colleagues as well as my students at the School of Molecular Medicine and the University of Cyprus whose constructive criticism and ideas helped shape the arguments of the book. I would like especially to thank my friends and collaborators, Vassos Neocleous, Fofi Constantinidou and Evridiki Papastavrou who agreed to review selected portions of the manuscript, while still in preparation, and make useful and well taken comments through which the final product became comprehensive and readable. I would also like to thank my colleague Yiannis Laouris for his encouragement and guidance through the process of finishing a book, selecting a publisher, and overcoming the hurdles and particulars of such an endeavour. My scientific secretarial assistants Elena Polycarpou and Christina Hadjiyianni were invaluable in helping me put the manuscript together and structure it according to the publisher’s instructions. My commissioning editor, Benedict Hill was helpful along the way with useful information, answers, and help regarding the final version of the book. In fact, I was impressed with the professionalism, patience and the impeccable approach of the staff at Edward Elgar Publishing who were involved in the production of this book. I would especially like to mention Harry Fabian, editorial assistant; Damian Penfold, copy editor; and Robert Pickens, desk editor. Their help and support are much appreciated.

Last but not least, I must acknowledge my immediate family, my wife Maria, son Symeon, and daughter Andriana for their support, patience, and willingness to forgo valued family time with me in order to allow me the pursuit of this project.
