List of Figures

2.1 The optimal allocation of labor in corn production 68
2.2 Income distribution in a classical corn economy 70
2.3 Adjustment path towards the steady state after an increase in agricultural productivity or when agricultural taxation is reduced 74
2.4 Income distribution in the neoclassical manufacturer world 81
3.1 The wage-profit curve and the conflict over income distribution with manufactured means of production 89
3.2 Empirical wage-profit curves under different consumption baskets 105
4.1 The wage-profit curve for $\kappa \equiv k_2/k_1 = 1$ (measured in terms of good 2) 117
4.2 $w(r)$ and $p_1(r)$ curves for $\kappa \neq 1$ 119
4.3 The consumption-growth trade-off for $\kappa \neq 1$ 121
4.4 The determination of average capital intensity $p_1k$ 125
4.5 The closure of the classical model by subsistence wages $w = \bar{w}$ and the savings hypothesis $g = s_kr$; for $\kappa > 1$ ($p_2 = 1$) 125
4.6 The growth-profit curve for $k_k = 0$, i.e. $gp_1k = s_w(w + rp_1k)$ 129
4.7 The $g-r$ savings relationship for non-uniform capital intensities 131
4.8 The $g-r$ curve for $k_1 = k_2$ 132
4.9 Pasinetti ($\bar{w}_2$) and Anti-Pasinetti ($\bar{w}_1$) outcomes under the classical closure 132
4.10 Sectoral labor intensities for $py = 1$ as function of the rate of profit $r$ 134
4.11 Sectoral labor intensities for $py = 1$ over selected ranges of the rate of profit $r$ 135
4.12 The prices of sectors 2-4 for $py = 1$ as a function of the profit rate $r$ 136
List of Figures

4.13 The prices of sectors 5-7 for \( py = 1 \) as a function of the profit rate \( r \)
4.14 The sectoral labor intensities for \( pq^n = 1 \) as function of the rate of profit \( r \)
4.15 The prices of sectors 2-4 for \( pq^n = 1 \) as function of the rate of profit \( r \)
4.16 The prices of sectors 5-7 for \( pq^n = 1 \) as function of the rate of profit \( r \)
4.17 Sectoral capital intensities \( k_j \) as ratios of \( \bar{k} \) as a function of the profit rate
4.18 Prices from Table 3.5
4.19 National income and the wage-profit curve \( (l(I-\delta A)^{-1}b = 1 = pb) \)
4.20 Normalizing by net national product \( (py = 1 = l(I-\delta A)^{-1}y) \) for varying \( r \)
4.21 The illusion of a linear subdivision of national income
4.22 A simplification of the theory of income distribution? \([0 < s_w < s_k \leq 1]\)
4.23 Representing income distribution using the workers’ consumption basket as the numéraire \( (pc = pb = 1, py, w(r) \text{ from top to bottom}) \)
4.24 Representing income distribution by way of Sraffa’s Standard Commodity \( (pq^n = 1, py, w(r) \text{ from top to bottom}) \)
4.25 The representation of income shares in net national product \( (pq^n, py = 1, w(r) \text{ from top to bottom}) \)
4.26 Wage (lower line) and wage-plus-profit (upper line) shares in national product proper: \( y = x - A^d x \)
4.27 The wage-profit frontier of three alternative techniques in sector 1 and a single technique in sector 2 \( (p_2 = 1 \text{ in all three cases}, k = a_1/l) \)
4.28 The wage-profit frontier for equation (4.24) and \( p_1 = 1 \)
4.29 Smooth factor substitution in the one-good case \( (\delta = 0, k = a_1/l) \)
4.30 Each single technique is in operation at exactly one point of the enveloping strictly convex wage-profit frontier \( (w^{max} = 1/l, r^{max} = 1/a_1) \)
4.31 The classical closure and the choice of technique
4.32 The classical closure of the two degrees of freedom in the case of substitution for \( \kappa > 1, \kappa = 1, \kappa < 1 \)
7.1 An increase in net production possibilities and a decrease in the conventional measure of aggregate labor productivity ($p(0) = e'$)

8.1 Comparing conventional and Marxian labor productivity indices: $\pi^c_j; 1/v_j$

12.1 Differentiated sectoral rates of profit under exogenous real wage rates

13.1 Four wage-profit curves and their envelope
