

# List of Tables

---

1.1	An IO representation of the <i>Tableau Économique</i> for a closed economy	26
1.2	An aggregation example as starting point for a macroeconomic analysis of the circuit of income	26
1.3	The physical background of the <i>Tableau Économique</i>	27
1.4	The unit-output representation of the linear technology behind Quesnay's <i>Tableau</i>	28
1.5	The basic structure of a nominal IO table ( $\hat{p}[X_{ij}]$ )	30
1.6	The nominal unit coefficients of a linear technology behind Table 1.5: $A^{nom} = \hat{p}X\hat{x}^{-1}\hat{p}^{-1}$	31
1.7	The physical coefficients of a linear technology assumed behind the IO Table 1.5: $A = \hat{p}^{-1}A^{nom}\hat{p} = X\hat{x}^{-1}$ , $x = [x_1, \dots, x_n]'$ , $p = [p_1, \dots, p_n]$	31
1.8	A simple two-sector IO matrix	34
1.9	The two-sectoral standard aggregation	45
1.10	The 7-sector standard aggregation	47
1.11	Technological coefficients of the 7-sector aggregation (Germany, 2000)	48
1.12	Import shares (in percent) for the 7-sector aggregation	48
1.13	The Leontief-inverse $(I - A)^{-1}$ for the 7-sector aggregation (Germany, 2000)	49
3.1	Commodity valuations in Smith's "early and rude state"	85
3.2	Labor coefficients $l$ , capital intensities $k$ , and consumption structure $c$ (Germany, 1995)	100
3.3	Eigenvalues of the technological matrix $A = A_T$ from Table 1.11	101
3.4	Right-hand (RH) and left-hand (LH) eigenvectors of $A = A_T$	102
3.5	Production prices from equation (3.11)	103
3.6	Production prices in terms of labor commanded ( $w = 1$ )	106
7.1	The standard form of an IO table	214

7.2	Elementary IO table in matrix notation	216
7.3	A two-sector economy with profitable capital-using and labor-saving technical change (at constant prices $p(0) = e', w = 1$ )	221
8.1	Technological coefficients of the 7-sectoral aggregation IO matrix (Germany, 1995, sectors 1–7 as columns, per million Euro of output value)	240
8.2	Depreciation matrix $A^\delta$ (Germany, 1995)	240
8.3	Capital stock matrix $K$ (Germany, 1995)	242
8.4	Consumption vs. final demand (million Euro)	243
8.5	Labor values or total labor costs (persons per million Euro of output value)	247
8.6	Main results	250
8.7	Employment, labor value of capital stock, price value of capital stock, and relative value of capital stock (measured in million persons)	252
8.8	Data underlying the construction of matrices $K$ and $A^\delta$	255
8.9	CVAR resulting from different values of $\delta^{plt}$ and $\delta^{eqt}$	256
8.10	Empirical sectoral rates of profit (Germany, 1995)	257
8.11	German sectoral profit rates (profits per unit of capital goods advanced) over the 1990s	258
9.1	A version of Steedman's two-sector corn economy	264
10.1	A joint production example economy	285
10.2	The monetary equivalent of Table 10.1	286
10.3	An arbitrary homogeneity assumption	286
10.4	An arbitrary sales transfer assumption	287
10.5	Negative coefficients in single IO tables	291
10.6	A method that rules out negative coefficients in single IO tables	292
10.7	The theoretical IO framework of the SNA	297
11.1	The two-sector corn economy again	336
11.2	The two-sector corn economy with rising efficiency	338
11.3	The two-sector corn economy with Sraffa's vintage prices	340
12.1	Sectoral price components (Germany, 1995)	346
12.2	Empirical two-sectoral data for equation (12.7) (Germany, 1995)	352
