# List of figures

1.1 Burden of a product tax 3  
1.2 Abatement under an emissions tax 4  
2.1 Distribution of household income levels in the counties of the Canadian province of Ontario 45  
2.2 Representing real-world features as vector or raster data 48  
2.3 GDP generated in flood-prone areas of the Netherlands 50  
2.4 GIS viewshed calculation of viewable area from one point on a specified property 52  
2.5 Modelled emissions of CO and NO$_2$ in Birmingham, UK; cumulative frequency of persons in five ethnic groups with respect to exposure to CO pollution 55  
2.6 Conventional approach to aggregating WTP data; GIS-based approach to aggregation allowing for spatial variation in population and income distribution and distance decay and income influences upon marginal WTP 59  
2.7 Isochrone map for a single recreational site; isochrone map for all wildlife parks in the UK 63  
2.8 Examples of types of neighbourhood analysis for raster data 66  
2.9 Official counts of recreational visits to UK woodlands and visits predicted by GIS-based models 69  
2.10 GIS-generated map of the marginal value of predicted woodland recreation demand for potential forest sites in Wales 72  
2.11 A local indicators of spatial association map for expert ratings of the intensity of random camping in the East Slopes Region of Alberta, Canada 78  
2.12 Two illustrations of first-order contiguity binary weights matrices constructed from a $3 \times 3$ regular lattice 82  
2.13 Spatial distribution of fishing package prices at remote tourism sites in Ontario 84  
2.14 Spatial autocorrelograms of the natural logarithm of weekly prices at fly-in accessible tourism sites in Ontario 85  
5.1 The chain from transport activity to valuation of disturbance 210  
5.2 Competition between transport modes in urban areas 242
