Preface and acknowledgements

The origins of this book are in research undertaken for my PhD from 2003 to 2006. However, the thinking behind it comes from my time in the Australian Commonwealth Public Service. Commencing as a keen economics graduate with the Department of Industry, Technology and Commerce in 1990, that which non-economists take for granted soon became obvious as I observed the policy process and its machinations. This is that all organizations, whether government departments, non-government organizations or firms, are complex. They are made up of human beings, operating in institutionally diverse environments, and motivated by a range of factors. For firms in particular, it seemed to me that while profits may be a key motivator, how these are defined and achieved is not an easy question to answer. This gave me the impetus to undertake study in politics and international relations, and eventually complete a PhD. As an academic now, it still seems odd to me that, even in the politics literature, while states, international organizations and civil society are reasonably well drawn, firms are mostly (albeit with some notable exceptions) simply sketched as instrumental profit seekers.

Being narrowly sketched as such, the potential for firms to take environmental concerns into account is usually seen in terms of presenting them with things to which they can react. The arguments go something like this. Threats are required, such as attacking their financial bottom lines via penalties for non-compliance with regulations, or taxing their products so that changes in market forces present them with no alternative but to change what they offer consumers. Alternatively, incentives are required such as subsidies for new products, or new market opportunities stemming from instruments such as emissions trading schemes. In the absence of state intervention, it is optimistically hoped that increased consumer desires for environmental responsibility may produce change, along with the idea that there are stakeholders with whom firms wish to form relationships in order to improve their financial performance. In short, firms are treated as the objects rather than the subjects of study.

So, I wanted to examine how firms are political actors along with others that are more central in political science, such as states, social movements and international organizations. Being worried about the environment, and recognizing the growing prominence of the global environmental
concern of climate change, I thought I should look at an industry sector that ‘matters’ (in terms of size and economic influence), preferably one composed of large corporations (preferably multinational corporations) and one that contributes to the environmental problem of climate change to such a degree that it will have to change quite dramatically to effect real change. I chose the car industry, and this book is the result. I hope it is helpful. In many ways, it is a piece of unfinished research that raises as many questions as it answers. Maybe this is the case with all research. Hopefully, the findings are intriguing enough for the paths to future study suggested to be taken up by some of its readers.

As is always the case, in doing the research for this book I received help from many people who deserve recognition. I am bound to leave someone out, and I hope they will forgive me if I do. My greatest thanks goes to Jason Sharman, who read many drafts of the chapters in this book and was instrumental in helping me to shape the research and present the results of it. I am also indebted to other members of the Department of Government and International Relations at the University of Sydney, and could easily thank all of them here. It is rare to find such a harmonious, supportive team of people! The following deserve special mention: Linda Weiss, Allan McConnell, Rodney Smith, Betsi Beem, Darryl Jarvis, Diarmuid Maguire, Rod Tiffen, Graeme Gill, Deborah Brennan, Lyn Carson, Ariadne Vromen, Susan Park and Shelly Savage. Also Dick Bryan from the Department of Political Economy.

For their constructive feedback on an early conference paper I would like to thank Jeff Harrod, Helge Hveem and Gerd Junne. For their constructive suggestions on my thesis, I thank Stephen Wilks, Russell Lansbury and Andrew Griffiths. Their advice, along with that of David Marsh and Neil Harrison, helped me to shape my thesis into this book.

More tangentially (in the sense of wide-ranging, mind-expanding discussion), Susan Shaheen helped me with some of my early thoughts on tackling the issues, as did Nic Lowe, the charismatic Director of CarShare Australia. John Wormald helped me to better understand how one may conceptualize the car industry as both global and national. Also thanks to Stuart White, Tom Berry and the staff of the Institute for Sustainable Futures at the University of Technology Sydney for their assistance.

I would also like to take this opportunity to say a big thank you to all the people at Ford, Toyota, BMW and Volkswagen who agreed to be involved. Your time and enthusiasm for this project, not to mention your freely-offered opinions, helped the research to ‘come alive’ in the latter stages of the book, and I hope I have not done you any disservice in how your comments have been reported. None is intended, and I am truly grateful. While on the car industry, I should also thank Carole
Bartholomew of the Victorian Department of Innovation, Industry and Regional Development, whose advice was helpful, and who got me a ticket to the International Automotive Conference in Melbourne in 2005. My good friend Robyn White also deserves thanks for introducing me to her and putting me up while in Melbourne.

This book started as a PhD, and other students toiling away on a remarkably eclectic range of topics, yet who provided incredible support and advice include Kriszti Molnar, Siobhan O'Sullivan, Lavina Lee and her husband John (especially for getting me a ticket to a conference where I met two very interesting and helpful executives from the Australian branch offices of Audi and Jaguar), Marcus Chadwick, Young Ju Kwon, Tony Stapledon, Nigel McCarthy, Sungyoung Kim, Adam Lockyer, Soojin Yoon, Dwane Byrne, Matthew Brazil and Debra da Silva.

Last, but not least, I must thank family and friends. You have all been so supportive and willing to listen to my diatribes about cars, capitalism and the environment with (almost) no complaints. My biggest thanks of all goes to my wife and best friend, Kara. She encourages and supports me in so many ways. I don’t always make this easy. I am ever grateful to my parents, Stella and Sid, for imbuing me with a sense that anything is possible, and therefore playing a large part in getting me to the point where I could imagine taking the time and putting in the effort to undertake such a project. I wish they had lived to see the results. Thanks are also due to my Aunt Teresa Moffett, for all her support. Finally, I must thank my daughters Annika and Erin, the first of whom was born at the beginning of this project, the latter at its conclusion. They both continue to teach me the most important lessons of all, including that a good meal is cause for dancing in your seat, and that however big the problem, however confusing the issues, you can always come home and pretend you are a tiger!

John Mikler
Sydney

A Note on Events in the Car Industry as the Book was Going to Press

Any piece of research is dated once published. Even so, the analysis employed in this book suggests that recent developments in the international car industry should not have been unexpected. For example, the prediction that European and Japanese car firms will find it easier than US firms to adjust to future imperatives has been quite dramatically borne out. Similarly, although fully electric cars are not considered, the fact that US firms are currently playing ‘catch up’ with their Japanese counterparts in respect of such vehicles is also not surprising. Therefore, in addition to providing a historical snapshot, hopefully the reader is provided with an analytical framework for understanding ongoing developments.
