Tables

4.1 Comparing four perspectives on MNC headquarters 90
5.1 Characteristics of network organization structure as applied to the MNC 108
5.2 Key areas where hierarchical structures are superior to network structures for providing intrafirm coordination 111
8.1 Correlation matrix: Pearson correlations 173
8.2 Proportional hazard regressions 174
8A.1 The sampled firms, divisions and sub-units 181
9.1 First-order latent variables operationalization 195
9.2 Item and construct reliability and average variance extracted for first-order reflective constructs 198
9.3 Item weights and multicollinearity tests for the formative construct 199
9.4 Latent variables: correlations and square root of the average variance extracted (AVE) 200
9.5 Endogenous variables: direct, indirect and total effects, explained variances and Stone–Geisser $Q^2$ test 201
10.1 Sample size and subsidiary employees in the different countries 219
10.2 OLS regression: internal knowledge sources of subsidiaries as the dependent variable 223
10.3 OLS regression with split sample: internal knowledge sources of subsidiaries as the dependent variable 225
11.1 Correlations between control variables and independent variables 244
11.2 Results of the regression analysis for transfer of subsidiary knowledge 245
11A.1 Characteristics of the sample 253
12.1 Parameter estimates, dependent variable: HQ impact on subsidiary competence development 272
12.2 Results of the ANCOVA test; pairwise comparison of four power difference acceptance situations 273
12A.1 Power distance scores of the countries in which the HQs of sample subsidiaries are located 280
