
Tables

4.1	Open-loop Nash equilibrium	63
4.2	Open-loop von Stackelberg equilibrium	65
4.3	Feedback von Stackelberg equilibrium	66
8.1	Optimal stock levels and optimal sustained yields for Antarctic baleen whales	115
12.1	Overview of environmental impacts of energy carriers and uses	178
12.2	Regional distribution of global primary energy use in 1971, 1980 and 1990	181
12.3	Potentials for energy efficiency improvement in major energy-consuming sectors in various regions and countries	188
13.1	Characteristics and implications of the allocative efficiency versus the equity perspective for studying external costs of road transport	208
13.2	The individual welfare positions associated with different schemes for optimizing externalities in a basic model	210
15.1	Factors affecting the choice of taxes versus standards	231
17.1	Rank order of policy instruments: high-to-low rent-seeking incentive	254
20.1	Three definitions of the double dividend	294
20.2	Effects of an ETR on employment in different models	300
21.1	Examples of pollution management settings	308
21.2	Instruments of environmental policy	309
21.3	An alternative taxonomy of environmental policy tools	311
21.4	Twenty-five years of studies that go beyond static efficiency in the examination of environmental policy instruments	316
21.5	A synthesis of criteria against which to judge policy instruments	321
24.1	Alternative equity criteria for global warming policy	370
24.2	Summary of permit trading and net welfare change associated with various equity criteria	373
27.1	Environmental impact of trade liberalization – small-country case	407
27.2	Welfare effect on a small country when larger countries regulate	408
27.3	Welfare effect of environmental regulation in large countries	411

30.1	Frequency and coverage indices for export products from developing countries to the EU market subject to environmental measures, 1992	457
33.1	Monetary $2 \times \text{CO}_2$ damage in different world regions	495
33.2	The social costs of CO_2 emissions	497
40.1	Estimated costs of transport in OECD countries as a percentage of GDP	582
40.2	Energy efficiency of transport modes	583
40.3	Policy instruments for containing the environmental intrusion of transport	586
41.1	A number of integrated assessment models for climate change	600
43.1	How we used up all the resources we had and still finished up with more than we started with	629
45.1	A comparison of the five perspectives based on the framework	651
45.2	Characteristics of the five perspectives	652
46.1	Overview of empirical studies that have used model (46.1) for estimating the relationship between pollutants and income	662
47.1	Typical examples of economy-wide concerns and policy tools to address them	679
47.2	Example of an action impact matrix	692
48.1	Comparison of social, economic and environmental sustainability	710
48.2	The definition of environmental sustainability	716
50.1	Poor economies with high export concentration in primary commodities	733
55.1	Studies in environmental, regional, urban and transport economics using meta-analysis	800
58.1	An evaluation table	838
58.2	Evaluation table of a transportation problem	846
58.3	Pairwise probabilities	848
60.1	World production of metal ores, 1993	868
60.2	Production and waste allocation for primary US metal production, 1988 and 1993	878
60.3	By-product and co-product groups	880
60.4	Indicators of unsustainability	882
60.5	Production and waste allocation for US industrial mineral production from domestic and foreign ores, 1988 and 1993	884
60.6	US recycling statistics and apparent consumption for selected metals, 1987–91	888

61.1	Major ecosystems of the world, their area and productivity	900
61.2	Ecosystems generate and sustain essential natural resources and ecosystem services	905
62.1	Nutrient reservoirs participating in global cycles	917
62.2	Ratios of C, N and P in various reservoirs	918
62.3	The stabilizing influence of the biosphere (Gaia)	936
64.1	Examples of transformities	956
64.2	Comparison of indicators in energy analysis and EMERGY analysis	958
67.1	Market and governmental intervention failures in coastal zones	1006
73.1	Development status of integrated assessment models	1130
73.2	The degree of disaggregation in French energy–economy models	1133
73.3	A comparison of top–down and bottom–up models	1135
74.1	Data for a simple decomposition example	1149
74.2	Decomposition results obtained using the energy intensity approach and the data in Table 74.1	1150
74.3	Decomposition results obtained using the energy consumption approach and the data in Table 74.1	1153
74.4	Decomposition results for specific cases of parametric Divisia index methods obtained using the energy intensity approach and the data in Table 74.1	1155
74.5	Comparisons of the results given by the conventional and refined Divisia index methods using the data in Table 74.1	1157
75.1	Decomposition of change in energy demand	1170
75.2	Percentage change in intermediate sector energy demand in the US, 1972–82	1174
