Ideas about this book emerged at Delft University of Technology, home of the principal editor. It was specifically the challenge to bring together the many ‘scattered’ research results on contributions of cities to sustainability transitions, as more widely understood than environmental sustainability alone. Besides energy and transport systems, the book also includes the healthcare system.

The results reported in this book were not only achieved by ‘home’ graduates and doctoral students but also the wider global research community. With the aim to make the book truly global and to include a typical example of a city involved in sustainability technology, the principal editor connected with a city that clearly witnessed the rise and partial fall of a specific energy technology, fuel cells and hydrogen: Vancouver. As a result, J. Adam Holbrook at the Simon Frazer University became a member of the editorial team.

Appreciation and thanks go to the Faculty of Technology, Policy and Management at the Delft University of Technology for facilitating and supporting the composition of the book and for the motivation of the contributors working at this faculty. Thanks also to all the other contributors for their dedication and hard work, sometimes done under difficult circumstances. Ultimately, it was the city itself that provided most of the inspiration for this book. While cities are the ‘arena’ where the majority of sustainability problems arise, they are also at the core of the creativity, invention, commercialization, ‘bottom-up’ energy and endurance among citizens to experiment at the practical level, and of specific governance and policy to accelerate and reach higher levels of sustainability.

Appreciation also goes to Matthew Pitman and Elizabeth Clack (Edward Elgar) for their kind support and cooperation in the editorial process.
