Preface

The ratification and entry into force of the Paris Agreement on climate change constitutes an important milestone in international climate negotiations. The Agreement has as its objective the strengthening of the global response to climate change by transitioning the world to a greener economy.

This volume of the *Critical Issues in Environmental Taxation* series addresses green market transitions by examining carbon taxes, subsidies, and support schemes for carbon and energy policies. It also reflects on the underlying policy dynamics and constraints of related fiscal measures. In addition, contributions touch on the important issue of smart instrument mixes reviewing how instruments can work in harmony together.

We hope you enjoy reading these studies and find them worthy of serious consideration.
